1. A positive gap means that Canadian born individuals have a higher value for that variable than Immigrants and a negative gap means the opposite. For variables where higher values mean better outcomes (for example, the "% of the population with a job"), a positive gap means Immigrant performance is not as good as Canadian born performance. For variables where higher values mean worse outcomes (for example, the "% of the labour force who are unemployed"), a positive gap means Immigrant performance is better than Canadian born performance. The greater the number, the greater the inequality between the two groups. For variables that measure a societal good, such as education achievements or a societal bad such as unemployment rates, the goal is to minimize the gap between the two groups.
